

Treat Snoring with Tap

The Thornton Adjustable Positioner (TAP) is an FDA approved medical device. By advancing and stabilizing the mandible in a forward position the TAP helps to maintain an open airway during sleep. TAP offers dentists the means to help patients with a serious medical condition, obstructive sleep apnea. TAP also reduces or eliminates snoring in more than 96% of patients using the appliance.

The TAP appliance includes upper and lower custom occlusal guards the hook together but allow some lateral range of motion. The patented TAP connector includes a screw mechanism that allows either the patient or the dentist to titrate the device for comfort and efficacy. This adjustable feature helps to improve patient compliance.

Please call our office if you would like further information or to make an appointment for treatment with the TAP appliance.
